

CELANEX® 2500

unfilled easy flowing nucleated, lubricated and stabilized grade

Chemical abbreviation according to ISO 1043-1: PBT Moulding compound ISO 7792- PBT, MGHR, 08-030N

Polybutylene terephthalate, easy flow, nucleated grade

Flammability UL 94 HB Minimum thickness 1.0 mm.

Recognition by Underwriters Laboratories, USA (UL)

Additional information

Injection molding	Melt Temperature 250-260 °C
	Mold Temperature 75-85 °C
	Maximum Barrel Residence Time *) 5-10 min
	Injection Speed fast
	Peripheral screw speed max.0,3 m/sec
	Back Pressure 10-30 bar

CELANEX® 2500

Injection Pressure 600-1000 bar
Holding Pressure 400-800 bar
Nozzle Design open design preferred

Injection speed, injection pressure and holding pressure have to be optimized to the individual article geometry. To avoid material degradation during processing low back pressure and minimum screw speed have to be used. Overheating of the material has to be avoided. For grades containing flame retardants, a maximum temperature of 265 °C should not be exceeded.

Celanese recommends only externally heated hot runner systems.

*) If the cylinder temperatures are higher than the recommended maximum temperatures, the max. residence time in the barrel has to be reduced.

Processing Texts

Pre-drying

CELANEX should in principle be predried. Because of the necessary low maximum residual moisture content the use of dry air dryers is recommended. The dew point should be $\leq -30^{\circ}\text{C}$. The time between drying and processing should be as short as possible.

Longer pre-drying times/storage

For subsequent storage of the material in the dryer until processed (≤ 60 h) it is necessary to lower the temperature to 100°C .

Injection molding

Melt Temperature $250\text{--}260^{\circ}\text{C}$
 Mold Temperature $75\text{--}85^{\circ}\text{C}$
 Maximum Barrel Residence Time *) $5\text{--}10$ min
 Injection Speed fast
 Peripheral screw speed max. $0,3\text{ m/sec}$
 Back Pressure $10\text{--}30$ bar
 Injection Pressure $600\text{--}1000$ bar
 Holding Pressure $400\text{--}800$ bar
 Nozzle Design open design preferred

Injection speed, injection pressure and holding pressure have to be optimized to the individual article geometry. To avoid material degradation during processing low back pressure and minimum screw speed have to be used. Overheating of the material has to be avoided. For grades containing flame retardants, a maximum temperature of 265°C should not be exceeded.

Celanese recommends only externally heated hot runner systems.

*) If the cylinder temperatures are higher than the recommended maximum temperatures, the max. residence time in the barrel has to be reduced.

Injection molding Preprocessing

To avoid hydrolytic degradation during processing, CELANEX resins have to be dried to a moisture level equal to or less than $0,02\%$. The drying should be done in a dry-air dryer (dew point $< -30^{\circ}\text{C}$) with a temperature of 120 to 140°C and a drying time of 2 to 4 hours. In case of longer residence times in the dry-air dryer, the temperature should be reduced to 100°C .

The time between drying and processing should be kept as short as possible. The processing machine feed hopper should be closed during the processing operation.
